Brake specific fuel consumption (BSFC) is a parameter that reflects the efficiency of a combustion engine which burns fuel and produces rotational power (at the shaft or crankshaft). In automotive applications, BSFC is used to evaluate the efficiency of the internal combustion engines (ICE). The keyword “ brake ” is related to the use of a

Brake-specific fuel consumption is a measure of the fuel efficiency of any prime mover that burns fuel and produces rotational, or shaft power. It is typically used for comparing the efficiency of internal combustion engines with a shaft output. It is the rate of fuel consumption divided by the power produced. It may also be thought of as power-specific fuel consumption, for this reason. BSFC allows the fuel efficiency of different engines to be directly compared.

What is Brake Specific Fuel Consumption? (with picture)

Brake specific fuel consumption: The literal meaning of bsfc is how much fuel is consumed in one hour to produce one kilowatt brake power (i.e. power available at engine shaft not power produced in engine block). It is used to measure fuel efficiency and also to compare internal combustion engines on basis of shaft power.
