A software-based digital media processing system is composed of three entities: an algorithm (that which processes), a software language (to

Get Free Digital Media

implement the processing), and embedded hardware.

Digital media processing algorithms are divided into four categories: data, signal and image, speech and audio, and video. Each category of algorithms is briefly discussed in this chapter. Digital media processing

...

Digital signal processing (DSP) is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety

Get Free Digital Media

of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency.
