The finite element method (FEM), or finite element analysis (FEA), is a computational technique used to obtain approximate solutions of boundary value problems in engineering. Boundary value problems are also called field problems. The field is the domain of interest and most often represents a physical structure.

The aim of this tutorial is to give an introductory overview of the finite element method (FEM) as it is implemented in NDSolve. The notebook introduces finite element method concepts for solving partial differential equations (PDEs). First, typical workflows are discussed. The setup of regions, boundary conditions and equations is followed by the solution of the PDE with NDSolve.

FEM2D_BVP_LINEAR, a Python program which applies the finite element method, with piecewise bilinear elements, to a 2D boundary value problem over a rectangle. The boundary value problem (BVP) that is to be solved has the form: - d/dx (a(x,y) * du/dx) - d/dy (a(x,y) * du/dy) + c(x,y) * u(x,y) = f(x,y)
